Getting help

help.start() Opens an interactive html page with several help resources

? **‘function’** to get help with a specific function, don’t include the quotation marks!

args() to see the arguments that a function is expecting

Creating and Importing Data

c() combine or concatenate values, separated by commas

data.frame() create data frame

read.csv() read csv file into a data frame

Statistical Analysis

Regression

lm() create a linear model ($y = f(x)$ or $y \sim x$)

ANOVA, t-test, etc

t.test() test two vectors

aov() create an object analysis of variance, where $y = f(x)$ or $y \sim x$

Tests for Association

chisq.test()

fisher.test()

Logistic Regression

glm($y \sim x$, family=binomial(link=‘logit’))

Statistical Results

summary() coerce object into summary table

coef() extract coefficients from a model object (e.g. **lm**)

plot() when you plot a model, you’ll get four diagnostic plots that can be used to evaluate the assumptions.

predict()

Visual Display

plot() arguments can be in x,y or in a $y \sim x$ formula to create scatter plots

boxplot() boxplots are used for categorical predictors

abline() using values to create vertical, horizontal, or diagonal lines

par() controls display parameters
